                                                                                                                                                                                                              SUBCELLULAR LOCATION: IF THE N-TERMINUS IS A FUNCTIONAL SIGNAL SEQUENCE, THE PROTEIN IS PREDICTED TO BE ORIENTED TOWARD THE LUMEN OF THE ENDOPLASHIZ RETICULUM WITH BOTH TERMINI SERVING AS ANCHORS. THE LACK OF A SIGNAL SEQUENCE INDICATES THAT THE ENZYME FACES THE CYTOPLASM AND IS ANCHORED AT THE C-TERMINUS.

DOMAIN: THE N-TERMINUS OF THE PROTEIN, THOUGH NOT HYDROPHOBIC, MEETS EXISTING CRITERIA FOR YEAST SIGNAL SEQUENCES, EVEN THOUGH NO SITE EXISTS FOR CLEAVAGE BY SIGNAL PEPTIDASE.

SIMILARITY: BELONGS TO THE GLYCOSYLIRANSPERASE FAMILY 2.
mitted (APR-1995) to the EMBL/GenBank/DDBJ databases.
FUNCTION: INVOLVED IN THE SYNTHESIS OF THE SUGAR DONOR DOL-P-MAN WHICH IS REQUIRED IN THE SYNTHESIS OF N-LINKED AND O-LINKED OLIGOSACCHARDS.
CAPALYTIC ACTIVITY: GDP-MANNOSE + DOLICHYL PHOSPHATE - GDP + DOLICHYL PHOSPHATE - GDP + DOLICHYL PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Arthropoda, Tracheata, Hexapoda, Insecta,

bin/display?db=wormace&class=Sequence &object=C50B6
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small important: This sequence is not the entire insert of clone C50B6. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota: Matazoa: Nematoda; Secernentea; Rhabditia; Rhabditida; Rhabditina; Rhabditoidea; Rhabditidae; Peloderinae; Caenorhabditis.

Submitted (17-AUG-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA

On Sep 20, 1999 this sequence version replaced g1:5748857.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft' sequence. It currently consists of 76 contigs. The true order of the pieces

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will

* be preserved.

On Sep 12, 1999 this sequence version replaced gi:5777438.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may be sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq_documentation_block:

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently consists of 81 contigs. There order of the pleces

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

* NOTE: This is a 'working draft' sequence. It currently

* consists of 63 contigs. The true order of the pleces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NA HTG 03-AUG-1999 clone CIT978SKB_54G2, *** SEQUENCING IN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extending host range or toxicity of insecticidal proteins - using protein capable of binding to gut epithelium of insects
Claim 34; Fig 21: 61pp; Engqlish.

This fusion gene comprises sequences isolated from the PG14 strain of B. thuringiensis subsp. morrisoni. The cytA gene encodes a cytOlytic protein which has high affinity for the lipid portion of cell membranes. After ingestion by insects, the 27 kDa Cyt A protein is cleaved by midgut proteases to a relatively resistant core of 25 kDa. The Cyt A coding sequence is combined with the Cry toxin, also from B.thuringiensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10-FEB-1992 (first entry)

The cyta gene encodes a cytolytic protein which has high affinity for the lipid portion of cell membranes. After ingestion by insects, the 27 kDa Cyt A protein is cleaved by midgut proteases to a relatively resistant core of 25 kDa. The Cyt A coding sequence is combined with the Cry toxin, also from B.thuringlensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extending host range or toxicity of insecticidal proteins - using protein capable of binding to gut epithelium of insects Claim 33; Fig 22; 61pp; English.
                                                                                                                                                                       10-FEB-1992 (first entry)

Btm PG14 72kDa Cry insecticidal protein/27kDa Cyt A fusion gene.

chimeric: fusion protein; insecticide; Lepidoptera larvae;

midgut targetting; Cry A; bacterial endotoxin; ss.

Bacillus thuringiensis subspecies morrisoni.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    913 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI: 99-081273/07.

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis (Lim 1; Page 386-370; 1150pp; English.

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-MAY-1999 (first entry)
Polynucleotide sequence from the genome of Treponema pallidum.

   Fowl poxylius-originated 5 kb DNA vector with hetrologous genes ruseful as a vaccine, providing large copy number per cell, with superior preventive efficacy
Claim 2: Page 36-39; 58pp; Japenese.
This sequence is used in the construction of a new vector originated from fowlpox virus which can duplicate poxylius in infected cells. The DNA vector can be used to produce vaccines for preventing and/or treating infection caused by poxylius including orthopoxylius and chicken poxylius. The DNA vector is about 5 kb and is concomitant. It can grow in

memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
the S aureus DNA sequences allows putative functions to be assigned so
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
colypeptides can also be used in a kit for the immunodetection of
S.aureus in a sample. S.aureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, food poisoning, osteomyelitis,
skin and surgical wound infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transformed with the DNA sequences can be used
for recombinant production of the polypeptides. The new DNA sequences
(and their fragments) are useful as primers or probes for isolating
computer readable medium.

Sequence 394 BP; 109 A; 85 C; 71 G; 126 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence encodes the Staphylococcus aureus gidB protein of the rivertion. GidB polymucleotides and polypeptides are useful for invention. GidB polymucleotides and polypeptides are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the GidB gene or analysing for the presence of amount of gidB polypeptide expressed in a patient sample. GidB PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. GidB polypeptides and polymucleotides are infectious micro-organisms. GidB polypeptides and polymucleotides are infectious micro-organisms. GidB agonists and antagonists are bacteriostatic and bacteriocidal compounds which can be used in treatment to enhance or block GidB activity, therefore treating diseases caused by microbial infection, especially S. aureus diseases including microbial infection, especially S. aureus diseases including endocarditis and bacteraemia in cancer patients. Epitopes of GidB colypeptides and polynucleotides are useful immunogens for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-MAY-1999 (first entry) S. aureus gidB coding sequence. GidBs, mutation detection; bacteriostatic; bacteriocidal compound; microbial infection; osteomyelitis; septic arthritis; gene therapy; septic thrombophlebitis; acute bacterial endocarditis; bacteraemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Staphylococcus aureus GidB polypeptides and polynucleotides - useful as diagnostic reagents and for prevention and treatment of Staphylococcus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   34.00 Length: 10

                                                                                 for
anti-GidB antibodies for prevention of bacterial infections, and GidB polymucleotides can be used in genetic immunisation to prevent infections. GidB polympetides, polymucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection. GidB polypeptides and polymucleotides may also be used as reagents for sequence 810 Bp; 295 A; 113 C; 158 G; 244 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                07-MAY-1999 (first entry)

```
Polynucleotide(s) and proteins derived from Staphylococcus aureus retored on computer readable medium and used in the production of anti-S.aureus vaccines

Protection of proteins derived from staphylococcus aureus DNA sequences

Computer readable medium and used in the production of anti-S.aureus vaccines

Computer readable medium of 5191 Staphylococcus aureus DNA sequences

Computer readable sequences are recorded on a computer readable commonary (RAM), read-only memory (ROM) or CD-ROM, Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or likely to encode antigens have been identified and these polypeptides can also be used in a vaccine composition against S.aureus infection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteonyelitis, studing cellulitis, eyelld infections, food poisoning, osteonyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable medium.

The products are used to treat S. pneumoniae infection, particularly meningitis and gastritis. These antibacterial agents may also be used to treat in-dwalling devices to prevent infection or generally as wound treatments to prevent affection of generally as wound sequence 1300 Bp; 477 A; 195 C; 262 G; 365 I;

Equine dermal cells (NBL-6) were infected with EHV-4 strain 1942

Viral DNA, purified and a BamH1 library constructed in puc9.

Calcium shocked E. coli DHT cells were transformed with the
recombinant plasmids. Additional clones were derived from a
restriction digest of puc9 contg. the BamH1 G fragment. The
nucleotide sequence of a region of BamH1 G fragment spanning the gC
gene was determined. by analysis of overlapping sequences (SEQ ID no
2). Vaccines can be prepd. using this sequence, and they may be used
to protect horses against EHV-4 infection, inducing a higher level
of immunity and less side-effects than other live virus vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid sequence encoding EHV-4 gH or gC protein - used to produce a vaccine for protection of horses against EHV-4
EHV-4 gC gene.

PPSDB; W89445.

PT New isolated gidAl polypeptide from Staphylococcus aureus - used to diagnose, treat and prevent bacterial infections e.g. S. aureus and FT H. pylori and associated cancers, ulcers and gastritis and second and second as diagnose, the present sequence encodes a gidAl protein of Staphylococcus CT The present sequence encodes a gidAl protein of Staphylococcus aureus. GidAl proteins, nucleic acids and agonists are used to treat conditions requiring increased activity or expression of gidAl, while conditions (particularly bacterial infections) requiring CT inhibition of gidAl are treated by administering an antagonist, inhibitory nucleic acid or competitive polypeptide. The products are used to treat S. pneumonlae infection, particularly meningitis and calso Helicobacter pylori infections e.g. related cancers, ulcers and gastritis. These antibacterial agents may also be used to treat CT in-dwelling devices to prevent infection or generally as wound treatments to prevent adhesion of bacteria to matrix proteins.
